PERSONAL SUMMARY

Software engineer with 4 years of experience in large, event-driven services. I co-built an AI product that helps content creators in China deliver brand deals and shipped it end to end, from LLM integration, billing, payments to deployment, compliance. Before that I worked on dispute system at Cash App, and financial services in Bukalapak. Over 4 years I've built up my technical depth, learned to communicate clearly with non-engineers, and gotten fast at picking up new technologies. I've also worked closely with product teams on user issues, with legal teams on compliance requirements, and made pragmatic technical decisions in a fast-paced environment.

SKILLS

Programming Languages: Golang, Java, Kotlin, Rust (learner)
DB, Cache, Middleware: MySQL, PostgreSQL, Redis, Kafka, SQS Queue
Framework: gRPC, Golang web, Spring Boot, Retrieval-Augmented Generation
AI Tools: Claude Code, Cursor, MCP, Skill, Multi AI agents workflow
Others: RESTful, Docker, Datadog, Protobuf, CI/CD, ArgoCD, Terraform, Temporal, Serverless computing, AWS
Tech Keyword: Database System, Algorithm & Data Structure, OOP, Microservice, JWT, Event-driven architecture, Idempotency
Soft Skills: Clear and efficient communication with technical and non-technical stakeholders; strong cross-functional collaboration, end-to-end ownership mindset from design to delivery to monitoring; results and outcome driven

WORK EXPERIENCE

Heidi Health, Senior Software Engineer — Australia (Melbourne) June 2026 – Current

- Keywords: **Agentic Programming, Commerce Platform, Stripe, MongoDB**
- Automated account and subscription provisioning by integrating **HubSpot** with internal systems via webhooks, replacing manual workflows.
  - Partnered with Sales to understand requirements, align on workflow design, and set expectations before implementation.
- Collaborated with Product and Engineers from different teams to deliver the **Heidi 2 opt-in flow**, tailoring the opt-in experience across different user cohorts with different subscription tiers.
- Designed and leading the implementation of seat management for Heidi team / org to support having multiple subscription tiers in a team / org and drive protential revenue growth
- Built the team's first production observability dashboard, providing visibility into **commerce metrics** and service health.

Block (Cash App), Software Engineer — Australia (Melbourne) August 2024 – Mar 2026

- Keywords: **Kotlin, Event-driven systems, Temporal, Kafka, SQS, Event sourcing**
- Enhanced team's testing process by creating a tool to generate 20+ different dispute test cases in staging environment, saving over 90% of manual testing time
- Closely partnered with Product Managers and Dispute Customer Support team
  - Collaborated with Staff Software Engineers, implemented hypotheses and indicators driven comprehensive investigation framework (CIF) for dispute investigation
  - With CIF, efficiently replicate and analyze dispute decision-making patterns, enabling deeper insights into dispute outcomes for regulatory and complaint requirement
  - Designed and drove engineering work for automatic suggested indicators, collaborated with MLE and AI Engineers, developed 5+ suggested indicators, saved dispute investigation time
- Served as the **Engineering DRI** for dispute submission, investigation, and resolution of Afterpay Cash Card transactions.
  - Drove a project team has 3 engineers, partner with Product, Operations, and Legal teams to define and finalize requirements for dispute submission, investigation, and resolution workflows.
  - Proactively identified potential blockers early and drove timely escalation to ensure on-schedule delivery.

    - Lead sprint planning and provided weekly progress updates, clearly communicated status and risks to stakeholders.
    - As a key contributor to major code changes, mentor engineers and pair with teammates to drive progress and ensure high-quality delivery on time.
- Grew to be a reliable engineer for deep debugging and troubleshooting of complex service issues, both within individual services and across distributed systems.

Bukalapak, Software Engineer — Australia(Melbourne) June 2022 – June 2024

- Keywords: **Golang, Ruby, Grpc, JWT, Docker, Kubernetes**
- With senior engineers in the team, collaborated with engineers to design systems and enhance backend performance using asynchronous job, cron job in Buka International team
- Elevated service reliability by **decoupling from legacy monolithic systems and spearheaded integration with an internal money-in, money-out ledger system, improve risk control and reliability**
- Utilized service metric and datadog to build real-time service performance analytical capability
- Balanced my role as an engineer between backend service development and infrastructure management, including tasks such as provisioning resources like databases, and service migration from Azure to GCP by IaC (Infrastructure as Code)

eBay, Software Engineer Intern — October 2021 – Feb 2022

- Keywords: **Java, Kafka, Kafka connector, Grpc, Messaging Middleware**
- Created a remediation application service to manage all kafka connectors efficiently
- Developed over 5 new **RESTful** and RPC API in the core messaging production using **gRPC** framework for connectors

Reduce over 50% of time and work to maintain kafka connectors and report abnormal error automatically

ByteDance, Software Engineer Intern — June 2021 – September 2021

- Keywords: **Java, Springboot, State machine**
- Refactored the back-End logic using **state-machine**, and make the transferring of Compiling to Deploying automatically

Finally, increase the stability and scalability of the Back-end implementation. The amount of users increases from 300 to 600+ inner Bytedance

EDUCATION

University of Melbourne — Melbourne, VIC

Bachelor of Science, Major of Computer and Software Engineering — *March 2019 – June 2022*

- Distinction
- H1 for most computer science related subjects

PROJECTS

Founding Engineer — EditXiaobian | *TypeScript, Supabase, Vercel AI SDK* — June 2026 – Oct 2026

- AI writing tool for Chinese creators doing sponsored content: turns a brand brief into a script that still sounds like the creator. Live at edixiaobian.com.
- Joined before there was a staging environment; by the time I left, real users were signing up, using the product and paying for it. Owned most of the money path.
- Designed and built billing end to end: subscription tiers with proration, Alipay and WeChat Pay integration, and per-user/per-project token metering for LLM usage.
- Acted as platform engineer: stood up staging, built CI/CD for deployments, and added offline prompt evaluation to CI and model fallback for primary-LLM outages.
- Mentored junior engineers through designing and building the admin console with weekly design reviews and feedback on code and communication.

Model Release Controller | *Java, Temporal, Python, MLflow* — 2026 – Present

- A safe-release system for ML models: every new version must pass gated stages (offline eval → shadow traffic → human approval → canary) before taking full traffic.
- Orchestrated the release pipeline as a durable Temporal workflow in Java, with Python activities pulling candidate models and metrics from MLflow; a failed gate or a crash mid-release resumes or rolls back cleanly instead of leaving traffic half-shifted.
- Built a Java traffic router supporting shadow mirroring and weighted canary splits, driven by the workflow's gate decisions.
- Added a release dashboard showing each candidate's stage, gate results and approval status.
